

CHARLES BLANCHARD

RESUME & PORTFOLIO

Charles Blanchard is a multifaceted artist and designer; founder of Super Systems Softworks, co-developer of Sky Rogue (PC, Xbox, Switch), Drift Stage (PC) - and director of numerous digital, print, and web projects.

Utilizing an array of techniques acquired over a decade of experience in the design and entertainment industry, in addition to over eight years of experience in game design and working in an interactive asset development pipeline.

Charles demonstrates a broad range of abilities - focusing on grid system based process design, with an emphasis on high contrast color theory and optical pattern bias - resulting in inventive solutions adapted for optimized and production minded workflows.

From 2014 to 2020, the majority of his work focused on mechanical design, developing a highly experimental and detail intensive approach for "high-res" pixel art applications with the racing game "Drift Stage". In addition to a combined effort over their college and early working career, proceeding until the present day - in producing the aerial combat game "Sky Rogue" and its related initiatives.

Charles highlights a working knowledge of multiple areas of discipline, in addition to contributions to numerous international market projects and regional properties - Charles offers a studied and varied academic background with output centric production methods. Experience with the methodology and technical limitations of pixel art production, taking both consumer and enthusiast expectations into account.

In addition to an education in art history, a catalogue of shipped products (digital and physical) lend Charles a familiarity with changing contemporary trends, market demands, a working knowledge of traditional fiction and literary themes, making for a uniquely qualified applicant.

Charles Blanchard | Graphic Design / Creative Director

Highly skilled and detail oriented artist and designer with versatile skill set across multiple mediums; Eleven years freelance experience in web, digital, print and 3D design. Co-founder & CCO Super Systems LLC. Over a decade of independent experience. Multiple shipped, long-term; cross-platform projects.

WORK EXPERIENCE

2015 — PRESENT

Super Systems Softworks LLC

Founder, CEO, CCO.

Design Lead.

Media Marketing Direction.

Asset and Financial Management.

Merchandise production and design, Licensing.

2014 — 2021

Sky Rogue (PC, Xbox, Switch)

Design Contractor.

Art Direction, Creative Lead.

3D & 2D Asset Creation and Conception.

Mechanical Design.

Marketing.

Alpha Testing & Debug Phases.

2012 — 2017

Freelance Designer (Various studios, greater NYC area.)

Development of product packaging elements, in conjunction with promotional web presence.

Production based design & iteration over multiple quarters.

Cross organization dynamics managed via multiple forms of communication and file-sharing platforms.

(email, phone, meetings, dropbox, physical postage, on-site delivery.)

APPLICABLE SKILLS

3D & 2D Design | Typography | Print Media | Concept Design | 3D Modeling | Print Media | User Interface Theory | Vector Art | Industrial Design | 3D Printing | Web Design |

EDUCATION

Associates in Applied Science | Communication Design | 2012 — 2014

Northampton Community College | Bethlehem, PA

GPA: 3.65

Deans list: 2012 — 2014

Phi Theta Kappa Honor Society 2014 - Present.

SOFTWARE PROFICIENCY

Adobe Illustrator 2020 | InDesign 2020 | Photoshop 2020 | After Effects 2020 | Maya | Blender | Marmoset Toolbox 4 | Autodesk 3D Studio Max |

LP400 Sports Car | 1664 Triangles

Brief:

The car model shown above represents a design process that incorporates the high-fidelity and nostalgic qualities of pixel art with low-polygonal, highly optimized 3D models. Taking advantage of the inherent qualities of a fully-lit material with no texture filtering, this style offers minimal performance impact, allowing for high density asset population in engine.

Marmoset Toolbag 4
Raytraced at 512 Samples

Reusing the same UV-mapping and base detail texture maps allows for a seamless and modular conversion to more contemporary art styles, using normal mapping and ambient occlusion to achieve different shading. The adaptability of this method allows for reusable assets given multiple art-directions or concepts that would normally require entirely new models and textures. Used in conjunction with shaders, this process yields detailed and efficient assets.

Texture Process | LP400 Sports Car

The approach taken in creating the maps for both variations of the “LP400” model, employ an iterative process, starting with an initial monochrome detail map, derived from a single 256x diffuse map.

This map is then traced with a vector art program, allowing for a scalable template for conversion into normal maps, or as a base for the diffuse map.

Wireframe

Wheel detail showcasing normal mapped pattern derived from vector file.

256 x 256 normal maps, down-scaled from high resolution.

1024 x 1024 normal maps, baked from vector file.

Comparison of 1024x and 256x normal mapping.

Dive Watch I 6560 Triangles

Brief:

This exercise demonstrates an efficient and adaptable modeling and texture solution that incorporates all of the necessary facets required in contemporary rendering pipelines; reducing the overall complexity and dependence on specialized tools and proprietary software.

By utilizing the inherent qualities of modern shaders; I opted for modular, monochromatic texture maps - all based on scalable vector art. This allows for in-engine conversion to normal maps, in addition to highly portable conversion to any other required map. The end result allows for easily repacked or compressed texture files, leaving final color & surface properties to the engine - while still maintaining ease of creation and modification with image-editors.

In regard to the geometry used on this project, a low poligonal base mesh was created, utilizing quads and easily subdiviable surfaces to allow for increased fidelity. This method also enables ease of modification of the basic case model - in order to create variations. Certain parts of the model, such as the bezel teeth - were made intentionally as simple as possible to showcase maximum optimization potential while still maintaining correct silhouetting and shape recognition.

Overall, the combined effect of highly optimized geometry, simple but detailed and effective material process, and a modular and portable workflow allow for high fidelity graphics in almost any rendering environment; irregardless of the type of shaders used, whether they be raytraced or a simple environemnt map.

Texture Examples | Dive Watch

Material Process:

The examples, shown above - demonstrate the process of the initial UV unwrapping, baking of ambient occlusion, creation of diffuse maps, and final composition; if applicable.

For the purposes of this model, multiple 1024x1024 texture maps were utilized. This method of mapping allows for the maximization of details, font clarity, and texel density for scalable optimization by reducing or increasing the maps exported size.

Thesis & Conclusion:

The initial goal of this project sought a highly portable and modular design process that yielded production quality, high detail assets with fewer dependencies on licenses and specialized software packages - all while maintaining maximum compatibility and portability with modern work environments; including game engines and more exotic rendering suites. Overall, the desired effect is achievable on both high and low specification hardware; making this process extremely versatile across mobile, web, and PC platforms.

1024x Normal Map + Diffuse

Material Example

Alternative Process Observations.

Application of post process optimizations resulted in a reduction of over half the triangles of the previous dive watch model; due to the absence of detail geometry on the clock dial's face - and overall triangle count reductions reflecting changes intrinsic to a simpler bezel design. This application relied on the conversion of a high detail vector file directly to a composited normal map.

Higher surface detail and precision can be employed when working with a 2D source file, outside of a typical modeling or rendering software pipeline.

Pixel Art

Charles has been producing pixel art of various specifications for over 20 years, starting at the age of eleven. Early reference came primarily from the study of 16 and 32 bit console and arcade games - eventually branching into an interest in hardware specific palettes; culminating in high detail images at multiple resolutions.

In addition, Charles has developed a number of original techniques in the application of hand-made pixel art to 3D models - specifically in the area of low-polygonal, unlit meshes. This same application allows for vivid greens and lush vegetation, as well as detailed and smooth solid surfaces designs.
